

# ION Enterprise

## Add UPS energy data without adding more hardware

The PowerLogic ION Enterprise Data Center Solution Pack is the ideal power management software tool for data centers and facilities with critical power needs. It provides electrical visibility and insight into your data center, helping you gain energy savings and overall improved efficiency and productivity.

### Monitor and view UPS loads

The PowerLogic ION Enterprise Data Center Solution Pack allows energy data from UPS devices to be combined with traditional metering equipment to provide a unified, low-cost monitoring solution that offers an easy-to-read Power Usage Effectiveness (PUE) interface.

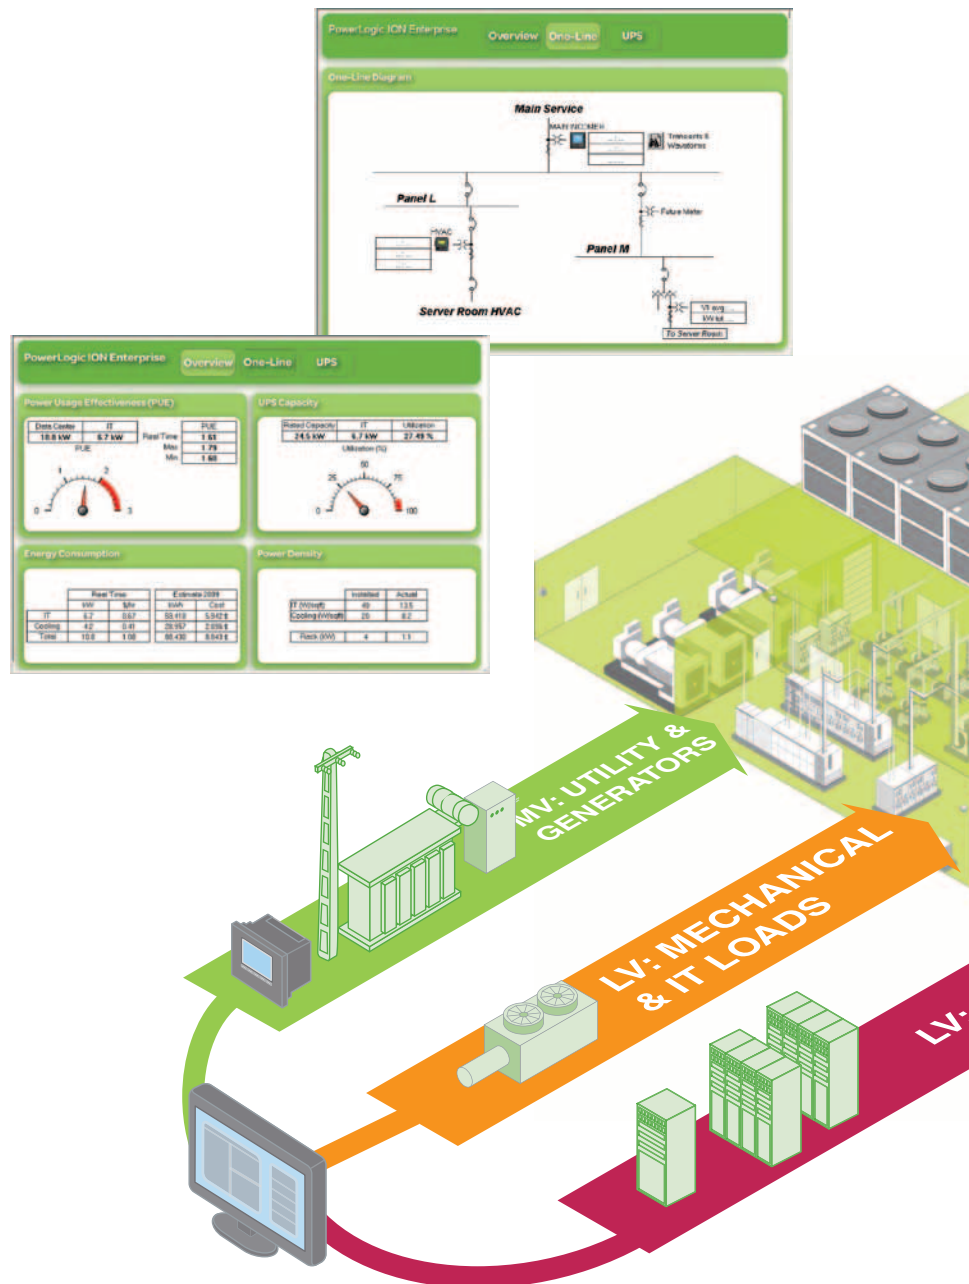

The system is ideal for facilities managers who want more UPS functionality detail without adding hardware, or for IT personnel who want a clearer look at electrical distribution information.

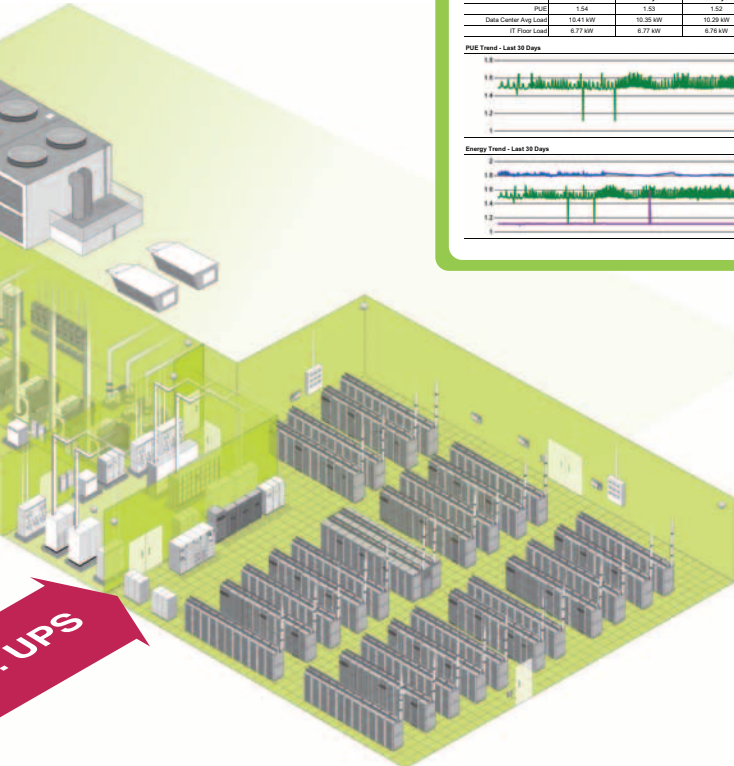

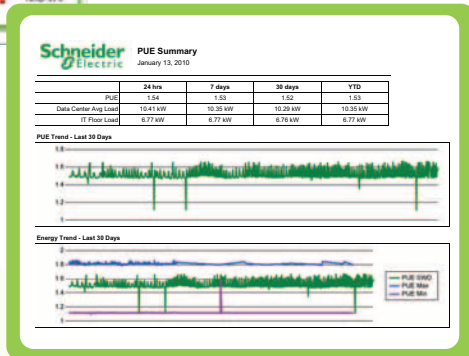

Monitor multiple device types via SNMP or Modbus, including:

- SmartUPS, UPS SC, UPS XL, UPSVT
- Symmetra UPS
- Symmetra PX 3ph, MW 3ph
- Gutor UPS 1ph
- SmartUPS 3ph
- Gutor UPS 3ph
- Galaxy (MGE) via SNMP

Coordinated capabilities can be used to monitor demand or power factor as well as UPS loads and generators. Customized information is easily shared with all stakeholders and with other business and automation systems, like Schneider Electric's Continuum software or APC by Schneider Electric's ISX Central software.\*

\* ISX Central users who also have ION Enterprise can simply access the data through a tab in the software interface..

## Energy intelligence

PowerLogic ION Enterprise software gives you a layer of energy intelligence, collecting and storing data from key electrical distribution points across your entire enterprise. It acts as a data-unified interface for electricity and other consumable resources; web-enabled monitoring and reporting gives you personalised access to timely, relevant information.

The software tracks real-time power conditions, providing the information you need to analyze power quality and reliability, and respond quickly to alarms to avoid critical situations. It helps you study trends to reveal energy waste or unused capacity as well as verify efficiency improvements and allocate costs.

Schneider Electric has additional solutions for larger facilities or more complex system requirements. Our solutions provide all of the necessary monitoring points to calculate PUE and understand the consumption characteristics of your facility.
